Phu Nguyen

For this project, Cyndy and I worked together on the data preparation and preprocessing. I mainly worked on choosing and downloading the dataset, setting up Python and Jupyter Lab, splitting the data, and doing the EDA. I also helped clean the data by checking missing values, “Unknown” values, outliers, the ID column, and the “Other” gender row. I worked on creating the bmi_category and age_group features as well. Cyndy worked more on the encoding, scaling, class balancing, and the before-and-after plots. We reviewed each other's work and worked together on the final datasets, proposal, and GitHub upload. I also used an AI assistant for some step-by-step guidance and code help, but I ran the code myself and checked the results.

Cyndy Ndong

Phu and I worked together closely throughout this project, discussing our results and making key decisions as a team while dividing up our responsibilities. Phu took the lead on initial exploration, helping research and evaluate datasets, and worked alongside me to structure our project goals and proposal ideas. Meanwhile, my main contributions focused heavily on preparing the cleaned data for machine learning and completing the final project deliverables. Specifically, I reviewed the cleaned dataset and worked directly with the features created during the cleaning process, performed the encoding and one-hot encoding on categorical data, and applied normalization and scaling to the numerical features. I also handled the class balancing to make the dataset suitable for machine learning, created the Matplotlib before-and-after plots to visually show the data distributions, and saved the final clean datasets in both numeric and readable versions while ensuring proper formatting. Beyond the technical pipeline, I helped finish the one-page proposal and dataset URL file, organized our project files, uploaded the completed work to GitHub, and reviewed the final work with Phu before our submission. Throughout this process, we constantly discussed our findings and results before making final decisions, and I utilized an AI assistant for step-by-step coding guidance while running and verifying all code outputs myself in Jupyter Lab.
